Registered Dietitian Nutritionists Improve Patient Outcomes

Results of studies of Registered Dietitian Nutritionists (RDNs) who use medical nutrition therapy (MNT) show improved patient outcomes in diabetes, hypertension, lipid metabolism disorders, HIV infection, pregnancy, chronic kidney disease, and unintended weight loss in older adults. Additionaly, RDNs have demonstrated improved outcomes related to weight management.

RDNs = Positive ROI

RDNs are key members of care teams who use their extensive training and expertise to deliver coordinated, cost-effective care that supports higher performance in value-based care models. They help patients achieve significantly improved outcomes with lower total cost of care.

Registered Dietitian Nutritionists

Optimizing Health through Food and Nutrition

Registered dietitian nutritionists, or RDNs, are the food and nutrition experts, translating the science of nutrition into practical solutions for healthy living. Working in a number of practice settings, RDNs advance the nutritional status of their patients and clients.

RDNs are recognized as the most qualified food and nutrition experts by the National Academy of Medicine (formerly IOM).¹

Physicians, clients, patients, industry and government agencies value and trust the contributions of RDNs. Primary care physicians identified dietitians as the most qualified provider to care for patients with obesity.²

70% indicated that RDNs are the most trusted source for information about what types of food to eat.

Registered dietitian nutritionists are everywhere and touch the lives of many.

1.5 BILLION estimated number of clients/patients counseled by RDNs yearly.

Numerous clinical guidelines and the United States Preventive Services Task Force (USPSTF) highlight that RDNs provide nutrition care more effectively at a lower cost than physicians, nurse practitioners, and physician assistants.
